

**Amine Use in High Pressure Power Plants (Joint project with Properties of Steam) - Group Co-chairmen Mike Rootham and Jim Bellows**

The results of the literature review on amine use in power plants were presented by Mike Rootham and Jim Bellows. Based upon the data collected during their review they concluded that additional information was needed to determine whether the presence of amine additives and their decomposition products has either a beneficial or adverse effect on turbine materials of construction in plants with steam generators operating with pressures above 900 psig. An outline of a test program to obtain these data was prepared and discussed with the meeting attendees.
